

## In above program we have used EH statements

**throw** for throwing an exceptions with error message if given inputs/arguments are wrong

**throws** for reporting/informing the exceptions those are throwing out from this method

**try** for placing exception causing statements and further try to catch this exception in this current method itself.

**catch** for catching the exception that is raised in try block, and further to place this caught exception handling code to take necessary actions on this exception either displaying error message or doing some other work.
