

try, catch execution flow
inner try, catch execution flow

- 1) try is always executed when control entered into a method
- 2) try block all statements may or may not be executed
it is depending on inputs we passed.
- 3) If exception is not raised in try block, control will go after
try, catch blocks and the rest of the statements placed inside
method are executed
- 4) if exception is raised, control is sent to this exception
matched catch block, after catch block execution, control
goes after try, catch and executes the rest of the statements
placed inside this method.
- 5) a catch block is executed only if its parameter type
exception is raised in its try block
- 6) if no catch block is not matched with the raised exception,
this exception is caught by JVM default handler, program terminates
