

throw	throws
1) throw is used for throwing an exception manually by a programmer when wrong inputs are passed according current method logic. 2) After throw keyword we must place exception object. 3) After throw keyword, only one exception object is allowed 4) throw keyword must be used inside method body in logic 5) Most of the times we will use throw keyword for throwing checked & custom exceptions	1) throws is used for reporting the exceptions those are throwing out from this method. So that this method caller will provide try, catch block for this calling stament to catch this throwing exception and to complete his method logic execution smoothly. 2) After throws keyword we must place exception class name. 3) After throws keyword multiple exceptions class names are allowed. 4) we must use throws keyword in method prototype after method () 5) we will use throws keyword only for reporting checked exceptions and ofcourse it is mandatory.
