

throws keyword usage

It is only meant for informing the exceptions those are throwing out from a method to this method caller.

throws keyword will not throw any exception,
throw keyword is responsible to throw exception.

If we do not use throws keyword, the only problem is method caller will not know that there is an exception throwing from this method. Hence he will not add try, catch. Then his method(main method) logic execution will also be terminated abnormally.

Remember, even though we did not use throws keyword exception will be thrown to the calling method, it is because of throw keyword.

throws kw has impact only at development and compilation time. throws keyword does not have any importance at execution time. Either throws keyword used or not used JVM will send the exception to calling method.
