

throws keyword usage syntax

We must use throws keyword in a method/constructor prototype after (). After throws keyword we must place exception class names with comma(,) separator

```
class Example {
```

```
    void m1(int x) throws IllegalArgumentException, {  
        IllegalArgumentException
```

```
        if(x <= 0){
```

```
            throw new IAE("Donot pass -ve or zero");
```

```
        }
```

```
        if(x %2 != 0){
```

```
            throw new ISE("Donot pass ODD number");
```

```
        }
```

```
        Sopln("Business Logic goes here");
```

```
    }
```

```
}
```
