

Custom exceptions or User defined exceptions

An exception class that newly created by a developer is called Custom or user defined exception.

A custom / user defined exception class is created by deriving from Throwable or one of its sub classes.

If we want to handle this custom exception mandatorily, we must derive it from Exception class. it will be a f ch exc

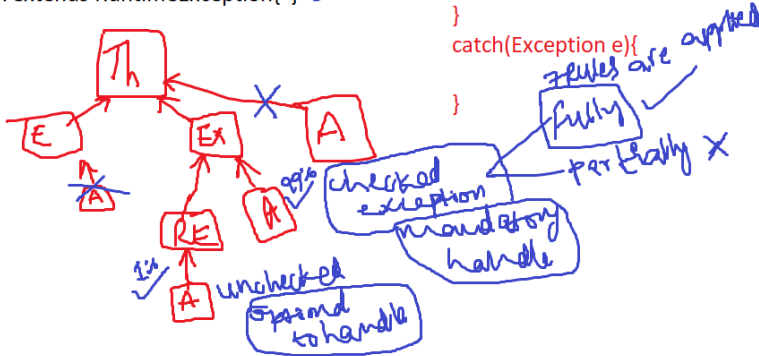

If we want to handle this custom exception optionally, we must derive it from RuntimeException class. it will be a un ch exc

class A extends Throwable{ } ~~✗~~
class A extends Error{ } ~~✗~~
class A extends Exception{ } ✓
class A extends RuntimeException{ } ✓

```
try{  
    }  
catch(----){  
    }  
catch(Exception e){  
    }  
}
```

rules are applied
fully
partially ✗

```
class Animal{ }  
class Lion extends Animal{ }  
  
class Laptop{ }  
class Lenovo extends Laptop{ }  
  
class Fruit{ }  
class Apple extends Fruit{ }
```

Procedure to create a custom exception

- 1) Create a package public class derived from an Exception class or one of its sub classes
- 2) We must define two constructor no-param and String param
- 3) If we want to support exception chaining we must define Exception paramter constructor too

What is the naming convention of an exception class?

<Problem>Exception
- InvalidAmountException
- InsufficientFundsException
